Competency 250 – Full Stack

Plan

Leader: L Shumlich

Date: 2019/04

Overview & Purpose

Python is a server language; one of its many strengths is a programming language for full stack development. It can be used to perform any server function, like accessing data in a database or file system and using the data to serve web applications.

Prerequisite

- 240 - Flask
- 930 - PostgreSQL

Exercise - Full Stack

Do this exercise on your own. Yes can you believe it? Using all your skills in your kitbag: JavaScript, React.js, PostgreSQL, python and flask build a Full Stack Application.
You can choose your own application but there must be at least 3 related tables and it must be a SPA (Single Page Application). You could use the same application from the SQL exercise. The application must include some CRUD functionality.

Review the project with Larry before you start.

Review with Larry when you are done.
